1 Significance of the Tables

The most common affix pair is theoretically contains the most commonly used affix in the language. In the case of the English file, the most common pair is Null-s. This reflects the pluralization of nouns. This is an extremely common practice in English, as almost all nouns are pluralized in this manner. Second most is Null-de, referring in most cases to adding the simple past tense morpheme -ed to a verb stem. This is again exceedingly common in English. At the moment, I am having trouble finding another dx1 file to run this on, as I did not do homework 1 (though I am remedying this right now since I want to use that data for another project).

2 Words with Multiple Signatures

The purpose of finding the words that are compared the most is that, assuming there are not many anagrams, it has the most forms also contained in the list. The most compared word in the English text is "stations". This seems like an unlikely word for such a high successful comparison rate. I think this is because there are anagrams of the word that also figure into its count.
